

Ex 14 Experiment to understand feature scaling.

```
import pandas as pd
from sklearn.preprocessing import StandardScaler

data = {
    "Age": [20, 25, 30, 35, 40],
    "Salary": [20000, 30000, 50000, 70000, 90000]
}

df = pd.DataFrame(data)

scaler = StandardScaler()
scaled = scaler.fit_transform(df)

print("Original Data:")
print(df)

print("\nScaled Data:")
print(pd.DataFrame(scaled, columns=df.columns))
```

```
... Original Data:
   Age  Salary
0   20  20000
1   25  30000
2   30  50000
3   35  70000
4   40  90000

Scaled Data:
   Age      Salary
0 -1.414214 -1.249390
1 -0.707107 -0.858956
2  0.000000 -0.078087
3  0.707107  0.702782
4  1.414214  1.483651
```
