

Ex 11 Experiment to understand pandas library use cases in Data science.

```
import pandas as pd

data = {
    "Name": ["Asha", "Ravi", "Kumar", "Priya"],
    "Marks": [85, 90, 78, 92],
    "Age": [20, 21, 19, 20]
}

df = pd.DataFrame(data)

print("Data:")
print(df)

print("\nMean Marks:", df["Marks"].mean())
print("Maximum Marks:", df["Marks"].max())
print("Minimum Marks:", df["Marks"].min())

print("\nSorted Data:")
print(df.sort_values("Marks", ascending=False))
```

```
Data:
...
   Name  Marks  Age
0  Asha     85   20
1  Ravi     90   21
2  Kumar    78   19
3  Priya     92   20
```

```
Mean Marks: 86.25
Maximum Marks: 92
Minimum Marks: 78
```

```
Sorted Data:
   Name  Marks  Age
3  Priya     92   20
1  Ravi     90   21
0  Asha     85   20
2  Kumar    78   19
```
